

Mykonos Software Named in Top 10 Security Innovators by Secure Computing World Congress

Mykonos Software to present at Security Throwdown in New York City.

Burlingame, CA and Rochester, NY – November 1, 2010 – Mykonos Software, the creator of the first appliance that provides real-time threat detection and management for Web applications, was selected as one of the Top 10 Security Innovators by Secure Computing Magazine's World Congress.

The selection means Mykonos Software will present, along with the nine other winners, at the Security Innovators Throwdown at SC World Congress (www.scworldcongress.com), the leading data security conference and expo on November 10-11, 2010 in New York City.

The top five companies, selected by a distinguished panel of judges, will be featured in a special edition of SCMagazine.

The Mykonos Security Appliance is the innovator in a brand new product category of proactive defense solutions. Unlike traditional security solutions that simply log the threat to a log file to be discovered days later, the Mykonos Security Appliance traps the attacker real-time, profiles them to understand the threat level, and then deploys real-time counter-measures to protect the website.

"Mykonos is honored to have been selected to present our solution at SC World Congress," said David Koretz, President & CEO. "The Mykonos team has spent countless hours pushing the thinking on how to protect companies from Web application attackers. We believe our ability to detect and track attackers before they successfully breach represents the foundation of the future of Web application security."

Mykonos Software was also named by Gartner as a 'Cool Vendor' in Application Security in 2010.

About Mykonos Software

Mykonos Software approaches Web application security differently. We understand how Web applications are abused by criminal attackers to steal data, commit fraud or even use company bandwidth for un-intended tasks. The Mykonos Security Appliance detects malicious abuse of web applications before the damage is done. This software solution profiles the abuse through intelligence gathering and responds to any abuse in real-time ultimately preventing data theft, fraudulent behavior and misuse of your Web properties.
